

## HTML CSS BootStrap - Assessment

### Introduction

This week you are required to build an online **food ordering application** that offers users a convenient and visually appealing platform to browse, select, and place orders for food items. The application will showcase a menu, allow users to input order details through a form, and display an order summary. This static application focuses on design, layout, and responsive behavior using **HTML, CSS, and Bootstrap**.

The project will assess your ability to organize content, integrate user inputs, and implement responsive design for a seamless user experience.

### Problem Statement

Your task is to build the following website sections -

#### 1. Navigation Bar -

Create a responsive navigation bar that includes:

- A **brand name** (For example: "Foodie's Delight").
- Navigation links for **Home**, **Menu**, and **Order Now** sections.
- A collapsible menu for smaller screens using Bootstrap's navbar utilities.

#### 2. Hero Section -

The homepage should include:

- A **hero banner** with a title, tagline, and a call-to-action button linking to the **Menu** section.

#### 3. Menu Section -

Showcase the menu items in a grid layout. Each food item should include:

- An **image**.
- A **name** and **price**.

#### 4. Order Form Section -

Design an order form where users can place orders. The form should include:

- **Name** and **Email** input fields.
- A **delivery address** textarea.
- A **dropdown menu** to select food items.
- A button to **Place Order** (non-functional).

#### 5. Order Summary Section -

Create a table to summarize the orders. The table should include:

- Food item name, quantity, price per item, and total price for each item.
- A header row with appropriate column names.

**6. Footer -**

Add a footer at the bottom of the page with:

- Copyright information.

Here is a sample website screenshot -
